

AMD has new 45nm quad core – Zosma

Colocado por nuno_p - 01 Fev 2010 21:06

Phenom II X4 960T is the name

Delta Leonis is a star in the constellation of Leo and natives calls it Zosma. Some even calls it Zozma or Duhr. This science class is less important than the fact that AMD's next generation 45nm quad core is codenamed Zosma.

You can expect it as early as Q2 2010, probably the middle part of it, and it is set to launch together with three new Hexa cores. We have a strong reason to suspect that Phenom II X4 960T 95W TDP quad-core is a six-core with two cores disabled, but we cannot confirm this at press time.

We don't know any clock speeds but we can tell you that it is a 45nm SOI (what else) part, that it supports DDR3 1333 and fits in AM3 motherboards. We still wonder what T stands for but we are quite sure it's not Terrestrial. Thuban perhaps?
